

## Florisil® for Preparative Chromatography

Composed of Magnesium and Silicon Oxides in the approximate ratio of 85:15. This is a polar phase used for the chromatography of compounds such as steroids and alkaloids. The activity can be controlled by the activation temperature used.

- 650 °C gives a highly active form, 260 °C a less active material

### Physical properties:

Composition: MgO 15.5%, SiO<sub>2</sub> 84.5%, Na<sub>2</sub>SO<sub>4</sub> 0.5% (max. 1%), pH approx. 8.5, specific surface area (BET) 300 m<sup>2</sup>/g, specific weight 2.51 g/ml

Description	Particle size (μm)	Pk	Cat. No.
Florisil® for residue analysis 60-100 Mesh	150-250	100 g	1.12994.0100
	150-250	1 kg	1.12994.1001

## Silica Gels for Preparative Chromatography, Standardised and Modified

Selection of Merck's standardised and modified silica gels that are available in many granulations and supplied from one single source, dedicated to chromatography. Standardised silica gels are widely used in separation processes to purify valuable compounds in ton quantities. Modified silica on the other hand is used in separation problems, which cannot be adequately solved using unmodified silica.

- Reliable results and easy sample application
- Variety of packing sizes from 250 g to 25 kg
- Economic alternatives to conventional types

**Delivery Information:** Supplied in plastic packaging.
